DEAD MAN'S SWITCH CONTINGENCY PROTOCOL

Purpose

This protocol exists as a defensive measure. It is designed to make any attempt to remove the primary administrator of Oracle through violence, arrest, or other permanent means significantly more costly and risky.

Activation

The protocol activates if the primary administrator is killed, arrested, or otherwise permanently removed from control of Oracle.

Execution

Upon activation, [REDACTED], a designated but unlisted guild member with access to Oracle systems will immediately open prediction markets on the deaths of the individual(s) responsible and the main leadership of the group behind the action (e.g., "Will X die by the end of Day Y? Yes or No").

All private funds and assets held by Oracle, including personal capital contributed by the administrator, will be directed into these markets, betting that the targets survive.

Market Effect

The resulting markets create what is commonly known as an *assassination market*. These markets create a financial incentive for the targets to be eliminated. Any third party, whether external groups or individuals inside the responsible organisation, can participate in two ways: they can anonymously bet on the targets' survival, thereby increasing the size of the payout if they die, or they can bet on the targets' deaths and attempt to eliminate them in order to claim the payout themselves. This effectively turns Oracle into an anonymous, publicly funded bounty supported by the targets' own enemies.

If the targets survive, those who funded the "bounty" by betting on the target's survival receive their money back, along with any returns. The same markets are then reopened the following day, with Oracle's funding placed back into the

market again. This process continues indefinitely until the targets are eliminated.

The targets would be forced to operate under constant pressure, never knowing whether an external threat or someone close to them might act for the payout.

Intent

This protocol is intended only as a deterrent. There is no plan to activate it unless the aforementioned conditions are met. It exists to raise the cost of targeting Oracle leadership to a level that makes such action impractical.

Access

Knowledge of this protocol is limited. Only the administrator and [REDACTED] are fully aware of the activation process and funding details. In situations where activation appears likely, the individuals or organisations involved may be informed of this protocol in advance, allowing them to fully assess the consequences of their actions.
